CONVERGENCE OF SPLIT-COMPLEX BACKPROPAGATION ALGORITHM WITH A MOMENTUM

Huisheng Zhang†, Wei Wu‡

Abstract: This paper investigates a split-complex backpropagation algorithm with momentum (SCBPM) for complex-valued neural networks. Convergence results for SCBPM are proved under relaxed conditions and compared with the existing results. Monotonicity of the error function during the training iteration process is also guaranteed. Two numerical examples are given to support the theoretical findings.

Key words: Complex-valued neural networks, split-complex backpropagation algorithm, convergence

Received: November 18, 2008
Revised and accepted: January 10, 2011

1. Introduction

In recent years great interest has been aroused in the complex-valued neural networks (CVNNs) for their powerful capability in processing complex-valued signals [1, 2, 3]. CVNNs are extensions of real-valued neural networks [4, 5]. A fully complex backpropagation (BP) algorithm and a split-complex BP algorithm are two types of complex backpropagation algorithms for training CVNNs. Unlike the case of the fully complex BP algorithm [6, 7], the operation of activation function in the split-complex BP algorithm is split into a real part and an imaginary part [2, 4, 5, 8]. This split-complex BP algorithm avoids occurrence of singular points in the adaptive training process. This paper considers the split-complex BP algorithms.

Convergence properties of the algorithm are an important issue of its successful training for neural networks. The convergence of the BP algorithm for real-valued neural networks has been analyzed by many authors from different aspects [9, 10, 11]. By using the contraction mapping theorem, the convergences in the mean and in the mean square for recurrent neurons were obtained by Mandic and Goh [12, 13]. For recent convergence analyses of complex-valued perceptrons and the BP algorithm for complex-valued neural networks, we refer the readers to [1, 14, 15].

It is well known that the learning process of the BP algorithm can be very slow. To speed up and stabilize the learning procedure, a momentum is often added to the BP algorithm. The BP algorithm with a momentum (BPM in short) can be viewed as a memory gradient method in optimization theory [16]. Starting from a point close enough to a minimum point of the objective function, the memory gradient method converges under certain conditions [16, 17]. This local convergence result is also obtained in [18] where the convergence of BPM for a neural network is considered. However, these results cannot be applied to a more complex case where the initial weights are chosen stochastically. Some convergence results for the BPM are given in [19]; these results are of global nature since they are valid for arbitrarily given initial values of the weights. Our contribution in this paper is to present some convergence results of the split-complex backpropagation algorithm with a momentum (SCBPM). We borrow some ideas from [19], but we employ different proof techniques resulting in a new learning rate restriction which is much relaxed and easier to check than the counterpart in [19]. Actually, our approach can be applied to the BPM in [19] to relax the learning rate restriction there. Two numerical examples are given to support our theoretical findings. We also mention a recent paper on split quaternion nonlinear adaptive filtering [20], and we expect to extend our results to quaternion networks in future.

The rest of this paper is organized as follows. A CVNN model with one hidden layer and the SCBPM are described in the next section. Section 3 presents the main convergence theorem. Section 4 gives two numerical examples to support our theoretical findings. The proof of the theorem is presented in Section 5.

2. The Structure of the Network and the Learning Method

Fig. 1 shows the CVNN structure considered in this paper. It is a network with one hidden layer and one output neuron. Let the numbers of input and hidden neurons be \( L \) and \( M \), respectively. We use \( (\cdot)^T \) as the vector transpose operator, and write \( \mathbf{w}_m = \mathbf{w}_m^R + i\mathbf{w}_m^I = (w_{m1}, w_{m2}, \ldots, w_{mL})^T \in \mathbb{C}^L \) as the weight vector between the input neurons and \( m \)-th hidden neuron, where \( w_{ml} = w_{ml}^R + iw_{ml}^I \), \( w_{ml}^R \) and \( w_{ml}^I \in \mathbb{R} \), \( i = \sqrt{-1} \), \( m = 1, \ldots, M \), and \( l = 1, \ldots, L \). Similarly, write \( \mathbf{w}_{M+1} = \mathbf{w}_{M+1}^R + i\mathbf{w}_{M+1}^I = (w_{M+1,1}, w_{M+1,2}, \ldots, w_{M+1,M})^T \in \mathbb{C}^M \) as the weight vector between the hidden neurons and the output neuron, where \( w_{M+1,m} = w_{M+1,m}^R + iw_{M+1,m}^I \), \( m = 1, \ldots, M \). For simplicity, all the weight vectors are incorporated into a total weight vector

\[
\mathbf{W} = ((\mathbf{w}_1)^T, (\mathbf{w}_2)^T, \ldots, (\mathbf{w}_{M+1})^T)^T \in \mathbb{C}^{ML+M}.
\]

Fig. 1 Structure of a CVNN.

For an input signal \( z = (z_1, z_2, \cdots, z_L)^T \in \mathbb{C}^L \), where \( x = (x_1, x_2, \cdots, x_L)^T \in \mathbb{R}^L \), and \( y = (y_1, y_2, \cdots, y_L)^T \in \mathbb{R}^L \), the input to the \( m \)-th hidden neuron is

\[
U_m = U_m^R + iU_m^I
\]
\[
= \sum_{l=1}^L (w_{ml}^R x_l - w_{ml}^I y_l) + i \sum_{l=1}^L (w_{ml}^I x_l + w_{ml}^R y_l)
\]
\[
= x^T w_m^R - y^T w_m^I + i(x^T w_m^I + y^T w_m^R).
\]

In order to apply the SCBPM to train a CVNN, we consider the following popular real-imaginary-type activation function [22]

\[
f_C(U) = f(U^R) + if(U^I)
\]

for any \( U = U^R + iU^I \in \mathbb{C} \), where \( f \) is a given real function (e.g., a sigmoid function). The output \( H_m \) of the hidden neuron \( m \) is given by:

\[
H_m = H_m^R + iH_m^I = f(U_m^R) + i(U_m^I).
\]

Similarly, the input to the output neuron is

\[
S = S^R + iS^I
\]
\[
= \sum_{m=1}^M (w_{M+1,m}^R H_m^R - w_{M+1,m}^I H_m^I) + i \sum_{m=1}^M (w_{M+1,m}^I H_m^R + w_{M+1,m}^R H_m^I)
\]
\[
= (H^R)^T w_{M+1}^R - (H^I)^T w_{M+1}^I + i ((H^R)^T w_{M+1}^I + (H^I)^T w_{M+1}^R)
\]
and the output of the network is given by

\[
O = O^R + iO^I = g(S^R) + ig(S^I),
\]
where $H^R = (H^R_1, H^R_2, \ldots, H^R_M)^T$, $H^I = (H^I_1, H^I_2, \ldots, H^I_M)^T$, and $g$ is a given real function. A bias weight can be added to each neuron, but it is omitted for simplicity of the presentation and deduction.

Let the network be supplied with a given set of training examples $\{z^j, d^j\}_{j=1}^J \subset \mathbb{C}^L \times \mathbb{C}$. For each input $z^j = x^j + iy^j$ ($1 \leq j \leq J$) from the training set, we write $U^j_m = U^j_m^R + iU^j_m^I$ ($1 \leq m \leq M$) as the input for the hidden neuron $m$, $H^j_m = H^j_m^R + iH^j_m^I$ ($1 \leq m \leq M$) as the output for the hidden neuron $m$, $S^j = S^j_R + iS^j_I$ as the input to the output neuron, and $O^j = O^j_R + iO^j_I$ as the final output. The square error function of CVNN trained by the SCBPM can be represented as follows:

$$E(W) = \frac{1}{2} \sum_{j=1}^{J} (O^j - d^j)(O^j - d^j)^*$$

$$= \frac{1}{2} \sum_{j=1}^{J} [(O^j_R - d^j_R)^2 + (O^j_I - d^j_I)^2]$$

$$= \sum_{j=1}^{J} [g_{j,R}(S^j_R) + g_{j,I}(S^j_I)], \quad (7)$$

where “($\cdot$)*” denotes the complex conjugate operator, $d^j_R$ and $d^j_I$ are the real part and imaginary part of the desired output $d^j$ respectively, and

$$g_{j,R}(t) = \frac{1}{2}(g(t) - d^j_R)^2, \quad g_{j,I}(t) = \frac{1}{2}(g(t) - d^j_I)^2, \quad t \in \mathbb{R}, 1 \leq j \leq J. \quad (8)$$

The purpose of the network training is to find $W^*$ to minimize $E(W)$. By writing

$$H^j = H^j_R + iH^j_I = (H^j_1, H^j_2, \ldots, H^j_M)^T + i[H^j_1, H^j_2, \ldots, H^j_M]^T, \quad (9)$$

we get the gradients of $E(W)$ with respect to $w^R_m$ and $w^I_m$ respectively as follows

$$\frac{\partial E(W)}{\partial w^R_m} = \sum_{j=1}^{J} \left[ g'_{j,R}(S^j_R)H^j_I + g'_{j,I}(S^j_I)H^j_R \right], \quad (10)$$

$$\frac{\partial E(W)}{\partial w^I_m} = \sum_{j=1}^{J} \left[ -g'_{j,R}(S^j_R)H^j_I + g'_{j,I}(S^j_I)H^j_R \right], \quad (11)$$

$$\frac{\partial E(W)}{\partial w^R_m} = \sum_{j=1}^{J} \left[ g'_{j,R}(S^j_R)(w^R_{M+1,m}f'((U^j_m)^R)x^j - w^I_{M+1,m}f'((U^j_m)^I)y^j) \right.$$

$$\left. + g'_{j,I}(S^j_I)(w^I_{M+1,m}f'((U^j_m)^R)x^j + w^R_{M+1,m}f'((U^j_m)^I)y^j) \right], \quad 1 \leq m \leq M, \quad (12)$$

$$\frac{\partial E(W)}{\partial w^I_m} = \sum_{j=1}^{J} \left[ g'_{j,R}(S^j_R)(-w^R_{M+1,m}f'((U^j_m)^R)y^j - w^I_{M+1,m}f'((U^j_m)^I)x^j) \right.$$

$$\left. + g'_{j,I}(S^j_I)(w^I_{M+1,m}f'((U^j_m)^R)y^j - w^R_{M+1,m}f'((U^j_m)^I)x^j) \right], \quad 1 \leq m \leq M, \quad (13)$$
finite points.

3. Main Results

Let \( \tau_m \) be the momentum factor, \( m = 1, 2, \cdots, M+1 \), and \( n = 0, 1, \cdots \). Then the SCBPM algorithm updates the real part \( w_m^R \) and the imaginary part \( w_m^I \) of the weights \( w_m \) separately:

\[
\Delta w_{m+1}^R = \Delta w_m^R - \eta \frac{\partial E(W^n)}{\partial w_m^R} + \tau_m^R \Delta w_m^R, \\
\Delta w_{m+1}^I = \Delta w_m^I - \eta \frac{\partial E(W^n)}{\partial w_m^I} + \tau_m^I \Delta w_m^I,
\]

where \( \eta \in (0, 1) \) is the learning rate, \( \tau_m^R \) and \( \tau_m^I \) are the momentum factors, \( m = 1, 2, \cdots, M+1 \), and \( n = 0, 1, \cdots \).

For simplicity, let us denote

\[
p_m^R = \frac{\partial E(W^n)}{\partial w_m^R}, \\
p_m^I = \frac{\partial E(W^n)}{\partial w_m^I}.
\]

Then (14) can be rewritten as

\[
\Delta w_{m+1}^R = \tau_m^R \Delta w_m^R - \eta p_m^R, \\
\Delta w_{m+1}^I = \tau_m^I \Delta w_m^I - \eta p_m^I.
\]

Similarly to the BPM [19], we choose the adaptive momentum factor \( \tau_m^R \) and \( \tau_m^I \) as follows:

\[
\tau_m^R = \begin{cases} 
\frac{\|p_m^R\|}{\|\Delta w_m^R\|}, & \text{if } \|\Delta w_m^R\| \neq 0, \\
0, & \text{else},
\end{cases}
\]

\[
\tau_m^I = \begin{cases} 
\frac{\|p_m^I\|}{\|\Delta w_m^I\|}, & \text{if } \|\Delta w_m^I\| \neq 0, \\
0, & \text{else},
\end{cases}
\]

where \( \tau \in (0, 1) \) is a constant parameter and \( \| \cdot \| \) is the usual Euclidian norm.

3. Main Results

The following assumptions will be used in our discussion.

(A1): There exists a constant \( C_1 > 0 \) such that

\[
\max_{t \in \mathbb{R}} \{ |f(t)|, |g(t)|, |f'(t)|, |g'(t)|, |f''(t)|, |g''(t)| \} \leq C_1.
\]

(A2): There exists a constant \( C_2 > 0 \) such that \( \|w_{M+1}^R\| \leq C_2 \) and \( \|w_{M+1}^I\| \leq C_2 \) for all \( n = 0, 1, 2, \cdots \).

(A3): The set \( \Phi_0 = \{ W | \frac{\partial E(W)}{\partial w_m} = 0, \frac{\partial E(W)}{\partial w_m} = 0, m = 1, \cdots, M+1 \} \) contains only finite points.
Theorem 1 Suppose that Assumptions (A1) and (A2) are valid, and that \( \{ w_n \} \) are the weight vector sequences generated by (14). Then, there exists a constant \( C^* > 0 \) such that for \( 0 < s < 1, \tau = s \eta \) and \( \eta \leq \frac{1-s}{C^*(1+s)^2} \), the following results hold:

(i) \( E(W^{n+1}) \leq E(W^n) \), \( n = 0, 1, 2, \cdots \);

(ii) There is \( E^* \geq 0 \) such that \( \lim_{n \to \infty} E(W^n) = E^* \);

(iii) \( \lim_{n \to \infty} \| \frac{\partial E(W^n)}{\partial w_{Rm}} \| = 0 \) and \( \lim_{n \to \infty} \| \frac{\partial E(W^n)}{\partial w_{Im}} \| = 0 \), \( 0 \leq m \leq M + 1 \).

Furthermore, if Assumption (A3) also holds, then there exists a point \( W^* \in \Phi_0 \) such that

(iv) \( \lim_{n \to \infty} W^n = W^* \).

The monotonicity and convergence of the error function \( E(W) \) during the learning process are shown in Conclusions (i) and (ii), respectively. Conclusion (iii) indicates the convergence of \( \frac{\partial E(W^n)}{\partial w_{Rm}} \) and \( \frac{\partial E(W^n)}{\partial w_{Im}} \), referred to as weak convergence. The strong convergence of \( W^n \) is given in Conclusion (iv). We note that the restriction \( \eta \leq \frac{1-s}{C^*(1+s)^2} \) in Theorem 1 is less restrictive and easier to check than the corresponding condition in [19]. We also mention that our results are of deterministic nature compared with a related work in [1], where the convergences in the mean and in the mean square for complex-valued perceptrons are obtained.

4. Numerical Example

In the following subsections we illustrate the convergence behavior of the SCBPM by using two numerical examples. In the both examples, we set the transfer function to be \( \text{tansig}(\cdot) \) in MATLAB, which is a commonly used sigmoid function, and carry out 10 independent tests with the initial components of the weights stochastically chosen in \([-0.5, 0.5]\). The average of errors and the average of gradient norms for all the tests in each example are plotted.

4.1 XOR problem

The well-known XOR problem is a benchmark used in literature on neural networks. As in [22], the training samples of the encoded XOR problem for a CVNN is presented as follows:

\[
\{ z^1 = -1 - i, d^1 = 1 \}, \{ z^2 = -1 + i, d^2 = 0 \}, \\
\{ z^3 = 1 - i, d^3 = 1 + i \}, \{ z^4 = 1 + i, d^4 = i \}.
\]

This example uses a network with one input node, three hidden nodes, and one output node. The learning rate \( \eta \) and the momentum parameter \( \tau \) are set to be 0.1 and 0.01, respectively. The simulation results are presented in Fig. 2, which shows that the gradient tends to zero and the square error decreases monotonically as the number of iteration increases and at last it tends to a constant. This supports our theoretical findings.
4.2 Approximation problem

In this example, the synthetic complex-valued function [23] defined as

\[ h(z) = (z_1)^2 + (z_2)^2 \]  

(19)

is approximated, where \( z \) is a two dimensional complex-valued vector comprised of \( z_1 \) and \( z_2 \). 10000 input points are selected from an evenly spaced \( 10 \times 10 \times 10 \times 10 \) grid on \(-0.5 \leq \text{Re}(z_1), \text{Im}(z_1), \text{Re}(z_2), \text{Im}(z_2) \leq 0.5 \), where \( \text{Re}(\cdot) \) and \( \text{Im}(\cdot) \) represent the real part and imaginary part of a complex number, respectively. We use a network with 2 input neurons, 25 hidden neurons and 1 output neuron. The learning rate \( \eta \) and the momentum parameter \( \tau \) are set to be 0.1 and 0.01, respectively. Fig. 3 illustrates the simulation results, which also support our convergence theorem.

5. Proofs

In this section, we first present two lemmas, then we use them to prove the main theorem.

Lemma 1 Suppose that \( \mathcal{E} : \mathbb{R}^{2^{ML+2M}} \rightarrow \mathbb{R} \) is continuous and differentiable on a compact set \( \Phi \subset \mathbb{R}^{2^{ML+2M}} \), and that \( \Phi_1 = \{ v | \frac{\partial \mathcal{E}(v)}{\partial v} = 0 \} \) contains only finite
Fig. 3 Convergence behavior of SCBPM for solving the approximation problem

\[(\text{norm of gradient} = \sum_{m=1}^{M+1} (\|p_m^n,R\|^2 + \|p_m^n,I\|^2)).\]

points. If a sequence \(\{v^n\}_{n=1}^{\infty} \subset \Phi\) satisfies

\[\lim_{n \to \infty} \|v^{n+1} - v^n\| = 0, \lim_{n \to \infty} \|\nabla E(v^n)\| = 0,\]

then there exists a point \(v^* \in \Phi_1\) such that \(\lim_{n \to \infty} v^n = v^*\).

**Proof** This result is almost the same as Theorem 14.15 in [21], and the detail of the proof is omitted.

For any \(1 \le j < J, 1 \le m \le M\) and \(n = 0, 1, 2, \cdots\), the following symbols will be used in our proof later on:

\[U_{m,j}^n = U_{m,j,R}^n + iU_{m,j,I}^n = (x_j)^T w_m^n,R - (y_j)^T w_m^n,I + i \left((x_j)^T w_m^n,I + (y_j)^T w_m^n,R\right),\]
\[H_{m,j}^n = H_{m,j,R}^n + iH_{m,j,I}^n = f(U_{m,j,R}^n) + if(U_{m,j,I}^n),\]
\[H_{n,j,R}^m = (H_{1,j,R}^n, \cdots, H_{M,j,R}^n)^T, H_{n,j,I}^m = (H_{1,j,I}^n, \cdots, H_{M,j,I}^n)^T,\]
\[S_{n,j}^m = S_{n,j,R}^m + iS_{n,j,I}^m = (H_{n,j,R}^m)^T w_{M+1}^n,R - (H_{n,j,R}^m)^T w_{M+1}^n,I + i \left((H_{n,j,R}^m)^T w_{M+1}^n,I + \right.\]
\[\left. + (H_{n,j,I}^m)^T w_{M+1}^n,R\right),\]
\[\psi_{n,j,R}^m = H_{n+1,j,R}^m - H_{n,j,R}^m, \psi_{n,j,I}^m = H_{n+1,j,I}^m - H_{n,j,I}^m.\]

(20)
Lemma 2 Suppose Assumptions (A1) and (A2) hold, then for any \(1 \leq j \leq J\) and \(n = 0, 1, 2, \ldots\), we have

\[
\begin{align*}
|O^{j,R}| &\leq C_0, |O^{j,I}| \leq C_0, \|H^{n,j,R}\| \leq C_0, \|H^{n,j,I}\| \leq C_0, \quad (21) \\
|g'_{j,R}(t)| &\leq C_3, |g'_{j,I}(t)| \leq C_3, |g''_{j,R}(t)| \leq C_3, |g''_{j,I}(t)| \leq C_3, t \in \mathbb{R}, \quad (22) \\
\max\{&\|\psi^{n,j,R}\|^2, \|\psi^{n,j,I}\|^2\} \leq C_4(\tau + \eta)^2 \sum_{m=1}^{M} (\|p_{m,R}\|^2 + \|p_{m,I}\|^2),
\end{align*}
\]

\[
\sum_{j=1}^{J} \left( g'_R(S^{n,j,R}) \left( (H^{n,j,R})^T \Delta w_{M+1}^{n+1,R} - (H^{n,j,I})^T \Delta w_{M+1}^{n+1,I} \right) \\
+ g'_{j,I}(S^{n,j,I}) \left( (H^{n,j,R})^T \Delta w_{M+1}^{n+1,I} + (H^{n,j,I})^T \Delta w_{M+1}^{n+1,R} \right) \right) \\
\leq (\tau - \eta) (\|P_{M+1}^R\|^2 + \|P_{M+1}^I\|^2), \quad (24)
\]

\[
\sum_{j=1}^{J} \left( g'_R(S^{n,j,R}) \left( (\psi^{n,j,R})^T \Delta w_{M+1}^{n+1,R} - (\psi^{n,j,I})^T \Delta w_{M+1}^{n+1,I} \right) \\
+ g'_{j,I}(S^{n,j,I}) \left( (\psi^{n,j,R})^T \Delta w_{M+1}^{n+1,I} + (\psi^{n,j,I})^T \Delta w_{M+1}^{n+1,R} \right) \right) \\
\leq (\tau - \eta + C_5(\tau + \eta)^2) \sum_{m=1}^{M} (\|p_{m,R}\|^2 + \|p_{m,I}\|^2), \quad (25)
\]

\[
\sum_{j=1}^{J} \left( g'_R(S^{n,j,R}) \left( (\psi^{n,j,R})^T \Delta w_{M+1}^{n+1,R} - (\psi^{n,j,I})^T \Delta w_{M+1}^{n+1,I} \right) \\
+ g'_{j,I}(S^{n,j,I}) \left( (\psi^{n,j,R})^T \Delta w_{M+1}^{n+1,I} + (\psi^{n,j,I})^T \Delta w_{M+1}^{n+1,R} \right) \right) \\
\leq C_6(\tau + \eta)^2 \sum_{m=1}^{M+1} (\|p_{m,R}\|^2 + \|p_{m,I}\|^2), \quad (26)
\]

\[
\frac{1}{2} \sum_{j=1}^{J} (g''_{j,R}(t_{1}^{n,j})(S_{n+1,j,R}^{n,j,R} - S_{n+1,j,R}^{n+1,R})^2 + g''_{j,I}(t_{2}^{n,j})(S_{n+1,j,I}^{n,j,I} - S_{n+1,j,I}^{n+1,I})^2) \\
\leq C_7(\tau + \eta)^2 \sum_{m=1}^{M+1} (\|p_{m,R}\|^2 + \|p_{m,I}\|^2), \quad (27)
\]

where \(C_i\) (\(i = 0, 3, \ldots, 7\)) are constants independent of \(n\) and \(j\), each \(t_{1}^{n,j} \in \mathbb{R}\) lies on the segment between \(S_{n+1,j,R}^{n+1,R}\) and \(S_{n,j,R}^{n+1,R}\), and each \(t_{2}^{n,j} \in \mathbb{R}\) lies on the segment between \(S_{n+1,j,I}^{n+1,I}\) and \(S_{n,j,I}^{n+1,I}\).

**Proof** The validation of (21) results easily from (4)–(6) when the set of samples is fixed and Assumptions (A1) and (A2) are satisfied. By (8), we have

\[
\begin{align*}
g'_{j,R}(t) &= g'(t)(g(t) - O^{j,R}), \\
g'_{j,I}(t) &= g'(t)(g(t) - O^{j,I}), \\
g''_{j,R}(t) &= g''(t)(g(t) - O^{j,R}) + (g'(t))^2,
\end{align*}
\]
\[ g''_i(t) = g''(t)(g(t) - O^{J,i}) + (g'(t))^2, \quad 1 \leq j \leq J, \quad t \in \mathbb{R}. \]

Then (22) follows directly from Assumption (A1) by defining \( C_3 = C_1(C_1 + C_6) + (C_1)^2 \).

By (16), (17) and (18), for \( m = 1, \ldots, M + 1, \)
\[ \|\Delta w_{m}^{n+1,R}\| = \|\tau_{m}^{n,R}\Delta w_{m}^{n,R} - \eta P_{m}^{n,R}\| \leq \tau_{m}^{n,R}\|\Delta w_{m}^{n,R}\| + \eta \|P_{m}^{n,R}\| \leq (\tau + \eta)\|P_{m}^{n,R}\|. \]
(28)

Similarly, we have
\[ \|\Delta w_{m}^{n+1,J}\| \leq (\tau + \eta)\|P_{m}^{n,J}\|. \]
(29)

If Assumption (A1) is valid, it follows from (20), (28), (29), the Cauchy-Schwartz Inequality and the Mean-Value Theorem for multivariate functions that for any \( 1 \leq j \leq J \) and \( n = 0, 1, 2, \ldots \)
\[ \|\psi^{n,J,R}\|^2 = \|H^{n+1,J,R} - H^{n,J,R}\|^2 = \left\| \begin{pmatrix} \frac{f(U_{1}^{n+1,j,R}) - f(U_{1}^{n,j,R})}{2} \\ \vdots \\ \frac{f(U_{M}^{n+1,j,R}) - f(U_{M}^{n,j,R})}{2} \end{pmatrix} \right\|^{2} \]
\[ = \left\| \begin{pmatrix} f'(s_{1}^{n,j})(x^j)^T \Delta w_{1}^{n+1,R} - (y^j)^T \Delta w_{1}^{n+1,J} \\ \vdots \\ f'(s_{M}^{n,j})(x^j)^T \Delta w_{M}^{n+1,R} - (y^j)^T \Delta w_{M}^{n+1,J} \end{pmatrix} \right\|^{2} \]
\[ = \sum_{m=1}^{M} (f'(s_{m}^{n,j})(x^j)^T \Delta w_{m}^{n+1,R} - (y^j)^T \Delta w_{m}^{n+1,J})^{2} \]
\[ \leq 2(C_1)^2 \sum_{m=1}^{M} ((x^j)^T \Delta w_{m}^{n+1,R})^{2} + ((y^j)^T \Delta w_{m}^{n+1,J})^{2} \]
\[ \leq 2(C_1)^2 \sum_{m=1}^{M} (\|\Delta w_{m}^{n+1,R}\|^2 \|x^j\|^2 + \|\Delta w_{m}^{n+1,J}\|^2 \|y^j\|^2) \]
\[ \leq C_4 \sum_{m=1}^{M} (\|\Delta w_{m}^{n+1,R}\|^2 + \|\Delta w_{m}^{n+1,J}\|^2) \]
\[ \leq C_4(\tau + \eta)^2 \sum_{m=1}^{M} (\|P_{m}^{n,R}\|^2 + \|P_{m}^{n,J}\|^2), \]
(30)

where \( C_4 = 2(C_1)^2 \max_{1 \leq j \leq J} \{\|x^j\|^2, \|y^j\|^2\} \) and \( s_{m}^{n,j} \) is on the segment between \( U_{m}^{n+1,j,R} \) and \( U_{m}^{n,j,R} \) for \( m = 1, \ldots, M \). Similarly we can get
\[ \|\psi^{n,J,I}\| \leq C_4(\tau + \eta)^2 \sum_{m=1}^{M} (\|P_{m}^{n,R}\|^2 + \|P_{m}^{n,J}\|^2). \]
(31)

Thus, we have (23).
According to (16), (17) and (18), we have
\[
(p_m^{n,R})^T \Delta w_{m+1,R}^{n+1} + (p_m^{n,I})^T \Delta w_{m+1,I}^{n+1}
\]
\[
= -\eta ||p_m^{n,R}||^2 + ||p_m^{n,I}||^2 + \tau_{m}^{n,R}(p_m^{n,R})^T \Delta w_{m,R}^{n,R} + \tau_{m}^{n,I}(p_m^{n,I})^T \Delta w_{m,I}^{n,I}
\]
\[
\leq -\eta (||p_m^{n,R}||^2 + ||p_m^{n,I}||^2) + \tau_{m}^{n,R} ||\Delta w_{m,R}^{n,R}|| + \tau_{m}^{n,I} ||\Delta w_{m,I}^{n,I}|| ||p_m^{n,I}||
\]
\[
\leq (\tau - \eta) (||p_m^{n,R}||^2 + ||p_m^{n,I}||^2),
\]
where \(m = 1, \ldots, M, M + 1\). This together with (10) and (11) validates (24):
\[
\sum_{j=1}^{J} \left( g_{j,R}'(S_{n,j,R}) \left( (H_{n,j,R})^T \Delta w_{M+1}^{n+1,R} - (H_{n,j,I})^T \Delta w_{M+1}^{n+1,I} \right) \right.
\]
\[
+ g_{j,I}'(S_{n,j,I}) \left( (H_{n,j,R})^T \Delta w_{M+1}^{n+1,R} + (H_{n,j,I})^T \Delta w_{M+1}^{n+1,I} \right) \right)
\]
\[
= \sum_{j=1}^{J} \left( g_{j,R}'(S_{n,j,R})(H_{n,j,R})^T \Delta w_{M+1}^{n+1,R} + g_{j,I}'(S_{n,j,I})(H_{n,j,R})^T \Delta w_{M+1}^{n+1,I} \right)
\]
\[
- g_{j,R}'(S_{n,j,R})(H_{n,j,I})^T \Delta w_{M+1}^{n+1,I} + g_{j,I}'(S_{n,j,I})(H_{n,j,I})^T \Delta w_{M+1}^{n+1,I}
\]
\[
= (p_{m+1}^{n,R})^T \Delta w_{M+1}^{n+1,R} + (p_{m+1}^{n,I})^T \Delta w_{M+1}^{n+1,I}
\]
\[
\leq (\tau - \eta) (||p_m^{n,R}||^2 + ||p_m^{n,I}||^2).
\]
(33)

Next, we prove (25). By (2), (4), (20) and Taylor’s formula, for any \(1 \leq j \leq J\), \(1 \leq m \leq M\) and \(n = 0, 1, 2, \ldots\), we have
\[
H_{m}^{n+1,j,R} - H_{m}^{n,j,R} = f(t_{m+1,j,R}^n) - f(U_{m,j,R}^n)
\]
\[
= f'(U_{m,j,R}^n)(U_{m,j,R}^n - t_{m,j,R}^n) + \frac{1}{2} f''(U_{m,j,R}^n)(U_{m,j,R}^n - U_{m,j,R}^n)^2
\]
\[
(34)
\]
and
\[
H_{m}^{n+1,j,I} - H_{m}^{n,j,I} = f(U_{m,j,I}^n) - f(t_{m,j,I}^n)
\]
\[
= f'(U_{m,j,I}^n)(U_{m,j,I}^n - t_{m,j,I}^n) + \frac{1}{2} f''(U_{m,j,I}^n)(U_{m,j,I}^n - U_{m,j,I}^n)^2.
\]
(35)

where \(t_{m,j}^n\) is an intermediate point on the line segment between the two points \(U_{m+1,j,R}^n\) and \(U_{m,j,R}^n\) and \(t_{m,j,I}^n\) between the two points \(U_{m+1,j,I}^n\) and \(U_{m,j,I}^n\). Thus, according to (2), (12), (13), (14), (20), (32) and (34)–(35) we have
\[
\sum_{j=1}^{J} \left( g_{j,R}'(S_{n,j,R}) \left( (\psi_{n,j,R})^T w_{M+1}^{n,R} - (\psi_{n,j,I})^T w_{M+1}^{n,I} \right) \right.
\]
\[
+ g_{j,I}'(S_{n,j,I}) \left( (\psi_{n,j,R})^T w_{M+1}^{n,I} + (\psi_{n,j,I})^T w_{M+1}^{n,R} \right) \right)
\]
\[
= \sum_{j=1}^{M} \sum_{m=1}^{M} \left( g_{j,R}'(S_{n,j,R}) w_{M+1,m}^{n,R} f'(U_{m,j,R}^n) \left( (x^j)^T \Delta w_{m,R}^{n+1,R} - (y^j)^T \Delta w_{m,I}^{n+1,I} \right) \right)
\]
\[
- g_{j,R}'(S_{n,j,R}) w_{M+1,m}^{n,I} f'(U_{m,j,I}^n) \left( (x^j)^T \Delta w_{m,I}^{n+1,I} + (y^j)^T \Delta w_{m,R}^{n+1,R} \right)
\]
\[
85
\]
\[ \begin{align*}
&= \sum_{m=1}^{M} \left( \sum_{j=1}^{J} \left[ g^{j}_{R} \left( S^{n,j,I} \right) \left( u^{n}_{M+1,m} f^{\prime \prime}(U^{n,j,R}_{m}) x^{j} - u^{n}_{M+1,m} f^{\prime \prime}(U^{n,j,R}_{m}) y^{j} \right) \right] \right)^{T} \Delta w^m_{n+1,R} \\
&+ \sum_{j=1}^{J} \left[ g^{j}_{R} \left( S^{n,j,R} \right) \left( -u^{n}_{M+1,m} f^{\prime \prime}(U^{n,j,R}_{m}) y^{j} - u^{n}_{M+1,m} f^{\prime \prime}(U^{n,j,I}_{m}) x^{j} \right) \right]^T \Delta w^m_{n+1,I} \right) + \delta_1 \\
&\leq (\tau - \eta) \sum_{m=1}^{M} \left( \|p^m_{n,I}\|^2 + \|p^m_{n,R}\|^2 \right) + \delta_1, \tag{36}
\end{align*} \]

where

\[ \delta_1 = \frac{1}{2} \sum_{j=1}^{J} \sum_{m=1}^{M} \left( g^{j}_{R} \left( S^{n,j,I} \right) u^{n}_{M+1,m} f^{\prime \prime}(U^{n,j,R}_{m}) \left( (x^{j})^T \Delta w^m_{n+1,R} + (y^{j})^T \Delta w^m_{n+1,I} \right)^2 - g^{j}_{R} \left( S^{n,j,R} \right) u^{n}_{M+1,m} f^{\prime \prime}(U^{n,j,R}_{m}) \left( (x^{j})^T \Delta w^m_{n+1,I} + (y^{j})^T \Delta w^m_{n+1,R} \right)^2 \right) \]

Using Assumptions (A1) and (A2), (17), (18), (22) and the triangular inequality we immediately get

\[ \delta_1 \leq |\delta_1| \leq C_5 \sum_{m=1}^{M} \left( \|\Delta w^m_{n+1,R}\|^2 + \|\Delta w^m_{n+1,I}\|^2 \right) \]

\[ \leq C_5 \sum_{m=1}^{M} \left( \left(\tau_{n,m} \||\Delta w^m_{n,R}\| + \eta \|p^m_{n,R}\|\right)^2 + (\tau_{n,m} \||\Delta w^m_{n,I}\| + \eta \|p^m_{n,I}\|)^2 \right) \]

\[ \leq C_5 (\tau + \eta)^2 \sum_{m=1}^{M} \left( \|p^m_{n,R}\|^2 + \|p^m_{n,I}\|^2 \right), \tag{38} \]

where \( C_5 = 2JC_1C_2C_3 \max_{1 \leq j \leq J} \{|x^j|^2 + |y^j|^2\} \). Now, (25) results from (36) and (38).

According to (20), (22), (23) and (28) we have

\[ \sum_{j=1}^{J} \left( g^{j}_{R} \left( S^{n,j,R} \right) \left( (\nu^{n,j,R})^T \Delta w^m_{n+1,R} - (\nu^{n,j,I})^T \Delta w^m_{n+1,I} \right) \right) \]

86
Proof of Theorem 1. First we prove (i). By (24)–(27) and Taylor’s formula we have

$$E(W^{n+1}) - E(W^n)$$

and

$$\frac{1}{2} \sum_{j=1}^J (g''_{ji}(t_{1,j}^{n+1,j,R} - S^{n,j,R})^2 + g''_{ji}(t_{2,j}^{n+1,j,I} - S^{n,j,I}))$$

Finally we obtain (26) and (27).
\[ \begin{align*} 
&= \sum_{j=1}^{J} (g''_{j,R}(S^{n,j,R}) \left( (H^{n,j,R})^T \Delta w^{n+1,R}_{M+1} - (H^{n,j,I})^T \Delta w^{n+1,I}_{M+1} \right) \\
&\quad + g'_{j,I}(S^{n,j,I}) \left( (H^{n,j,R})^T \Delta w^{n+1,I}_{M+1} + (H^{n,j,I})^T \Delta w^{n+1,R}_{M+1} \right) \\
&\quad + g'_{j,R}(S^{n,j,R}) \left( (\psi^{n,j,R})^T w^{n,R}_{M+1} - (\psi^{n,j,I})^T w^{n,I}_{M+1} \right) \\
&\quad + g'_{j,I}(S^{n,j,I}) \left( (\psi^{n,j,R})^T w^{n,I}_{M+1} + (\psi^{n,j,I})^T w^{n,R}_{M+1} \right) \\
&\quad + g''_{j,R}(\ell^{n,j}_1)(S^{n+1,j,R} - S^{n,j,R})^2 + \frac{1}{2} g''_{j,I}(\ell^{n,j}_2)(S^{n+1,j,I} - S^{n,j,I})^2 \\
&\quad \leq (\tau - \eta + (C_0 + C_7)(\tau + \eta)^2) \left( \|p^{n,R}_{M+1}\|^2 + \|p^{n,I}_{M+1}\|^2 \right) \\
&\quad + (\tau - \eta + (C_5 + C_6 + C_7)(\tau + \eta)^2) \sum_{m=1}^{M} \left( \|p^{n,R}_m\|^2 + \|p^{n,I}_m\|^2 \right) \\
\end{align*} \] (41)

where \( \ell^{n,j}_1 \in \mathbb{R} \) is on the segment between \( S^{n+1,j,R} \) and \( S^{n,j,R} \), and \( \ell^{n,j}_2 \in \mathbb{R} \) is on the segment between \( S^{n+1,j,I} \) and \( S^{n,j,I} \).

Obviously, by choosing \( C^* = C_5 + C_6 + C_7 \) and the learning rate \( \eta \) to satisfy

\[ 0 < \eta < \frac{1 - s}{C^*(1 + s)^2}, \] (42)

we have

\[ \tau - \eta + (C_0 + C_7)(\tau + \eta)^2 \leq 0, \quad \tau - \eta + (C_5 + C_6 + C_7)(\tau + \eta)^2 \leq 0. \]

Then there holds

\[ E(W^{n+1}) \leq E(W^n), \quad n = 0, 1, 2, \ldots \] (43)

Conclusion (ii) immediately results from Conclusion (i) since \( E(W^n) \geq 0 \).

Next, we prove (iii). In the following we suppose (42) is valid. Let \( \alpha = -(\tau - \eta + (C_0 + C_7)(\tau + \eta)^2), \beta = -(\tau - \eta + (C_5 + C_6 + C_7)(\tau + \eta)^2), \) then \( \alpha \geq 0, \beta \geq 0. \) According to (41), we have

\[ E(W^{n+1}) \leq E(W^n) - \alpha(\|p^{n,R}_{M+1}\|^2 + \|p^{n,I}_{M+1}\|^2) - \beta \sum_{m=1}^{M} (\|p^{n,R}_m\|^2 + \|p^{n,I}_m\|^2) \]

\[ \leq \cdots \leq E(W^0) - \sum_{k=0}^{n} \left( \alpha(\|p^{k,R}_{M+1}\|^2 + \|p^{k,I}_{M+1}\|^2) + \beta \sum_{m=1}^{M} (\|p^{k,R}_m\|^2 + \|p^{k,I}_m\|^2) \right). \] (44)

Since \( E(W^{n+1}) \geq 0 \), there holds

\[ \sum_{k=0}^{n} \left( \alpha(\|p^{k,R}_{M+1}\|^2 + \|p^{k,I}_{M+1}\|^2) + \beta \sum_{m=1}^{M} (\|p^{k,R}_m\|^2 + \|p^{k,I}_m\|^2) \right) \leq E(W^0). \]
Let \( n \to \infty \), then
\[
\sum_{k=0}^{\infty} \left( \alpha \left( \| p_{M+1}^k \|_2^2 + \| p_{M+1}^k \|_2^2 \right) + \beta \sum_{m=1}^{M} \left( \| p_{m}^k \|_2^2 + \| p_{m}^k \|_2^2 \right) \right) \leq E(W_0) < \infty.
\]

Hence, there holds
\[
\lim_{n \to \infty} \left( \left\| \partial E(W_n) / \partial w_{Rm} \right\|_2^2 + \left\| \partial E(W_n) / \partial w_{Im} \right\|_2^2 \right) = \lim_{n \to \infty} \left( \| p_{m}^{n+1} \|_2^2 + \| p_{m}^{n+1} \|_2^2 \right) = 0,
\]
which implies
\[
\lim_{n \to \infty} \left\| \partial E(W_n) / \partial w_{Rm} \right\| = \lim_{n \to \infty} \left\| \partial E(W_n) / \partial w_{Im} \right\| = 0, \quad 1 \leq m \leq M + 1.
\]

Finally, we prove (iv). We use (14), (15), (28), (29), and (45) to obtain
\[
\lim_{n \to \infty} \| w_{m+1}^n - w_{m}^n \|_2 = 0, \quad \lim_{n \to \infty} \| w_{m+1}^n - w_{m}^n \|_2 = 0, \quad m = 1, \cdots, M + 1.
\]

Write \( v = ( (w_1^R)^T, \cdots, (w_{M+1}^R)^T, (w_1^I)^T, \cdots, (w_{M+1}^I)^T)^T \), then \( E(W) \) can be viewed as a function of \( v \), and denoted as \( E(v) \):
\[
E(W) \equiv E(v).
\]

Obviously, \( E(v) \) is a continuously differentiable real-valued function and
\[
\frac{\partial E(v)}{\partial w_{Rm}} \equiv \frac{\partial E(W)}{\partial w_{Rm}}, \quad \frac{\partial E(v)}{\partial w_{Im}} \equiv \frac{\partial E(W)}{\partial w_{Im}}, \quad m = 1, \cdots, M + 1.
\]

Let \( v^n = ( (w_1^R)^T, \cdots, (w_{M+1}^R)^T, (w_1^I)^T, \cdots, (w_{M+1}^I)^T)^T \), then by (45) we have
\[
\lim_{n \to \infty} \left\| \frac{\partial E(v^n)}{\partial w_{Rm}} \right\| = \lim_{n \to \infty} \left\| \frac{\partial E(v^n)}{\partial w_{Im}} \right\| = 0, \quad m = 1, \cdots, M + 1.
\]

From Assumption (A3), (46), (47) and Lemma 1 we know that there is a \( v^\star \) satisfying \( \lim_{n \to \infty} v^n = v^\star \). By considering the relationship between \( v^n \) and \( W^n \), we immediately get the desired result. We thus complete the proof.

\[\square\]
